

RETAIL BUSINESS INTELLIGENCE

Executive Decision Report

30-Day Internship Capstone • Business Intelligence & Data Analytics

Prepared for executive review | Source: Power BI Business Performance Dashboard

What management should know

The dashboard provides a consolidated view of revenue, customer segments, category performance, geography and time trends.

■ 28.72M REVENUE	■ 2.87K AOV	■ 1.22K CAC	38.5% CHURN
----------------------------	-----------------------	-----------------------	-----------------------

CORE FINDING

Revenue performance should be managed through category/location monitoring and customer-segment analysis.

KEY OPPORTUNITY

Use recurring KPI monitoring to identify high-performing areas, investigate weaker areas, and improve customer retention and promotion decisions.

Recommended actions

- Strengthen data quality and validation.
- Create disciplined KPI tracking for sales/category/location performance.
- Use customer and promotion analysis to improve retention and commercial targeting.

Decision questions

Translate dashboard evidence into actions that management can monitor and execute.

SALES PERFORMANCE

Understand overall revenue and transaction performance.

REVENUE DRIVERS

Compare categories, locations and customer segments.

CUSTOMER BEHAVIOR

Review New, Regular and Premium customer mix.

BUSINESS RISK

Identify data-quality gaps that can affect reporting.

Executive decision lens

Measure → identify variance → investigate → act → monitor. The capstone converts dashboard evidence into a repeatable management rhythm.

Dataset & analytical approach

The dashboard source identifies a 12,575-record dataset and presents the final analytical view in Power BI.

12,575 RECORDS	Power BI ANALYSIS TOOL	2025–2026 TIME COVERAGE	EXECUTIVE DASHBOARD OUTPUT
--------------------------	----------------------------------	-----------------------------------	--

- 01 Data cleaning**
Standardize fields and prepare analysis-ready data.
- 02 Quality review**
Check missing values, duplicates and consistency.
- 03 EDA**
Explore revenue, customer, category, location and time patterns.
- 04 KPI analysis**
Use revenue, AOV, CAC and churn as executive indicators.
- 05 Decision layer**
Convert findings into actions, controls and monitoring.

Category, location and commercial mix

The dashboard exposes category and location dimensions that can be used as recurring performance cuts.

CATEGORY VIEW

Electronics, Fashion and Home & Kitchen are explicitly represented in the category analysis. Beauty is also available as a category filter.

LOCATION VIEW

Bengaluru, Chennai, Coimbatore, Delhi and Hyderabad are available as location filters; the visual compares location-level revenue.

Management use

- Track category revenue monthly and flag material deviations.
- Compare locations using a consistent revenue/KPI definition.
- Pair quantity and spending analysis with category performance before changing assortment or promotion strategy.
- Use payment-method and item-level cuts where available in the underlying analytical model.

Customer mix and commercial health

The dashboard segments customers into New, Regular and Premium groups and reports executive acquisition/retention indicators.

SEGMENT LENS

Use customer-segment distribution to distinguish acquisition activity (New) from repeat/retention behavior (Regular and Premium).

RETENTION LENS

The 38.5% churn rate makes customer retention a key KPI to monitor alongside acquisition cost and average order value.

Decision implication: evaluate acquisition, retention and order value together rather than in isolation.

Revenue over time

The dashboard includes monthly revenue trend analysis and a year comparison for 2025 and 2026.

TIME-SERIES VIEW

The dashboard presents Revenue Trend by Month and Total Revenue by Year, with the visible year axis covering 2025 and 2026. Exact monthly values are not exposed in the supplied PDF, so no unsupported peak/low-month claim is made here.

MONITOR

Monthly revenue, transaction volume and variance against prior periods.

INVESTIGATE

Large month-to-month movements, category shifts, geographic changes and promotion effects.

Recommended cadence: monthly executive review with rolling comparison to the previous month and comparable period.

Data quality & reporting risk

The analytical process should retain explicit controls around data quality so management decisions remain reliable.

Missing product information — Can weaken item/category analysis and segmentation.

Missing prices or quantities — Can distort revenue, volume and AOV calculations.

Missing discount values — Can limit evaluation of promotion effectiveness.

Consistency issues — Different formats or definitions can create misleading comparisons.

CONTROL PRINCIPLE

Every executive KPI should have a documented definition, data owner, validation rule and exception-handling process.

Improve data quality

Make data reliability a formal operating control rather than a one-time cleaning activity.

ACTIONS

- Standardize transaction fields
- Validate missing/invalid values
- Define mandatory fields
- Add automated data-quality checks

SUCCESS KPIs

- Missing-value rate
- Invalid-record rate
- Duplicate rate
- KPI reconciliation exceptions

Expected business effect

More reliable reporting, fewer manual corrections and greater confidence in category, location and customer decisions.

Optimize sales performance

Turn dashboard comparisons into a recurring sales-management process.

ACTIONS

- Focus attention on strong-performing categories/items
- Investigate low-performing products
- Compare locations consistently
- Review monthly KPI variance

SUCCESS KPIs

- Revenue growth
- Category contribution
- Location contribution
- AOV and transaction volume

Expected business effect

Faster identification of commercial opportunities and underperformance, supported by consistent monthly management reviews.

Improve customer & promotion strategy

Use customer behavior and promotion analysis to improve retention and commercial efficiency.

ACTIONS

- Analyze discount effectiveness
- Target promotions using customer behavior
- Monitor retention alongside acquisition
- Review CAC and AOV together

SUCCESS KPIs

- Churn rate
- CAC
- AOV
- Incremental revenue from promotions

Scenario ROI — clearly labeled projection

Illustrative scenario: if the combined actions increase annual revenue by 5%, estimated incremental revenue = Current Annual Revenue × 5%. This is a planning scenario, not measured ROI from the supplied dashboard.

The supplied dashboard shows total revenue of ■28.72M, but the PDF does not establish an annualized revenue baseline. Therefore a precise ■ ROI figure is intentionally not invented.

30 / 60 / 90-day implementation

A phased rollout converts the capstone findings into an operating routine.

PHASE	TIMELINE	ACTION	EXECUTIVE CHECK
1	0–30 days	Data-quality improvements	Define controls + baseline data-quality KPIs
2	31–60 days	KPI/dashboard monitoring	Monthly review of revenue, AOV, CAC, churn
3	61–90 days	Customer & promotion optimization	Test targeted actions and measure incremental impact

Final executive takeaways

1. Protect decision quality with stronger data controls. 2. Establish monthly sales/KPI management. 3. Use customer and promotion analytics to improve retention and commercial efficiency.
